biocarta

BioCarta pathways

Description

A list with a [pathway](#) object for each BioCarta pathway.

<http://www.biocarta.com>

Pathway topology conversion

BioCarta pathways were retrieved in BioPax format from the PDI database web page.

We define a pathway for each BioPax tag “pathway”. Pathway nodes often correspond to multiple gene products. These can be divided into protein complexes (proteins linked by protein-protein interactions) and groups made of alternative members (genes with similar biochemical functions). Thus, when considering signal propagation these groups are considered differently. The first kind (hereafter group AND) should be expanded into a clique (all proteins connected to the others), while the second (hereafter group OR) should be expanded without connection among them. In the BioPax format only one type of group is allowed: protein complexes (group AND) with the tag ‘complex’. However, it often happens that the ‘protein’ tag contains multiple ‘xref’ pointing to alternative elements of the process (group OR).

Compound mediated interactions are interactions for which a compound acts as a bridge between two elements. Since chemical compounds are not usually measured with high-throughput technology, they should be removed from the network to analyse gene signals. However, the trivial elimination of the compounds, without signal propagation, will strongly bias the topology interrupting the signals that pass through them. If element ‘A’ is linked to compound ‘c’ and compound ‘c’ is linked to element ‘B’, element ‘A’ should be linked to element ‘B’. Not all compounds are considered for the propagation because some of them (for example: H₂O, ATP, ADP) are highly frequent in map descriptions and the signal propagation through them would lead to chains too long. Compounds not considered for propagation are not characteristic of a specific reaction, but act as secondary substrates/products widely shared among different processes.

graphite allows the user to see the single/multiple relation types that characterized an edge. The type of edges have been kept as much as possible similar to those annotated in the original data format. Some new types have been introduced due to topological conversion needs.

See Also

[pathway-class](#).

convertIdentifiers

Convert the node identifiers of a pathway.

Description

Converts the node identifiers of a pathway to either Entrez Genes or Gene Symbols.

Usage

```
convertIdentifiers(pathway, type)
```

Arguments

pathway a pathway from [biocarta](#), [kegg](#), [nci](#) or [reactome](#).
type the type of identifier: either "entrez" or "symbol".

Value

A pathway object.

See Also

[biocarta](#)
[kegg](#)
[nci](#)
[reactome](#)
[pathway-class](#)

Examples

```
p <- convertIdentifiers(reactome$'mTOR signalling', type="symbol")
```

cytoscapePlot	<i>Plot a pathway graph in Cytoscape</i>
---------------	--

Description

Renders the topology of a pathway as a Cytoscape graph.

Usage

```
cytoscapePlot(pathway, ...)
```

Arguments

pathway a pathway object.
... optional arguments to pass to [pathwayGraph](#).

Details

Requires the RCytoscape package.

See Also

[pathway-class](#)
[pathwayGraph](#)

Examples

```
## Not run: cytoscapePlot(convertIdentifiers(reactome$'Unwinding of DNA', "symbol"))
```

kegg

KEGG pathways

Description

A list with a [pathway](#) object for each KEGG pathway.

Ogata H, Goto S, Sato K, Fujibuchi W, Bono H, Kanehisa M. KEGG: Kyoto Encyclopedia of Genes and Genomes. *Nucleic Acids Res.* 1999 Jan 1;27(1):29-34.

<http://www.genome.jp/kegg/>

Pathway topology conversion

KEGG pathway were retrieved in KGML format from the KEGG ftp site.

KEGG database provides separate xml files, one for each pathway. A pathway is therefore define by all the reactions described within each file.

Pathway nodes often correspond to multiple gene products. These can be divided into protein complexes (proteins linked by protein-protein interactions) and groups made of alternative members (genes with similar biochemical functions). Thus, when considering signal propagation these groups are considered differently. The first kind (hereafter group AND) should be expanded into a clique (all proteins connected to the others), while the second (hereafter group OR) should be expanded without connection among them. In the KGML format there are two ways of defining nodes with multiple elements: protein complexes (group AND defined by entry type="group") and groups with alternative members (group OR defined by entry type="gene").

Compound mediated interactions are interactions for which a compound acts as a bridge between two elements. Since chemical compounds are not usually measured with high-throughput technology, they should be removed from the network to analyse gene signals. However, the trivial elimination of the compounds, without signal propagation, will strongly bias the topology interrupting the signals that pass through them. If element 'A' is linked to compound 'c' and compound 'c' is linked to element 'B', element 'A' should be linked to element 'B'. Within the KGML format there are two different ways of describing a compound mediated interaction: i) direct interaction type="PPrel" ('A' interacts whit 'B' through compound 'c') and ii) indirect one type="PCrel" ('A' interacts to compound 'c' and 'c' interacts with 'B').

Not all compounds are considered for the propagation because some of them (for example: H2O, ATP, ADP) are highly frequent in map descriptions and the signal propagation through them would lead to chains too long. Compounds not considered for propagation are not characteristic of a specific reaction, but act as secondary substrates/products widely shared among different processes.

graphite allows the user to see the single/multiple relation types that characterized an edge. The type of edges have been kept as much as possible similar to those annotated in the original data format. Some new types have been introduced due to topological conversion needs.

[pathway-class](#).

pathway-class

Class "pathway"

Description

This class represents a biological pathway.

Slots

title: Object of class "vector".

nodes: Object of class "vector".

edges: Object of class "data.frame". The data.frame has one row for each edge and four columns: source node, destination node, edge direction and type.

ident: Object of class "vector". The type of identifiers used to label the nodes. The value of "native" means that the identifiers are those present in the original pathway definition.

See [convertIdentifiers](#) to convert them.

database: Object of class "vector". The name of the database from which the pathway was retrieved.

timestamp: Object of class "Date". The date when the pathway was retrieved.

Methods

edges signature(object = "pathway"): retrieves the data.frame describing the pathway edges.

nodes signature(object = "pathway"): retrieves the vector enumerating the identifiers of the pathway nodes.

pathwayGraph

Graph representing the topology of a pathway

Description

Builds a graphNEL object representing the topology of a pathway.

Usage

```
pathwayGraph(pathway, edge.types=NULL)
```

Arguments

pathway a pathway object.

edge.types keep only the edges matching the type names in this vector.

Value

A graphNEL object.

See Also

[pathway-class](#)

[graphNEL-class](#)

Examples

```
g <- pathwayGraph(reactome$'mTOR signalling', edge.types=c("binding"))
```

prepareSPIA	<i>Prepare pathway dataset needed by runSPIA.</i>
-------------	---

Description

Prepare pathway dataset needed by runSPIA. See [runSPIA](#) and [spia](#) for more details.

Usage

```
prepareSPIA(db, pathwaySetName, print.names = FALSE)
```

Arguments

db	A list of pathways like biocarta , kegg.nci or reactome .
pathwaySetName	Name of the pathway set in output.
print.names	The verbose option.

Details

It is required to run this function before [runSPIA](#) to prepare the pathway set as required by runSPIA.

[pathway-class](#).

runDEGraph

Run topological analysis on expression dataset using DEGraph package. See [testOneGraph](#).

Description

DEGraph implements recent hypothesis testing methods which directly assess whether a particular gene network is differentially expressed between two conditions. See [testOneGraph](#) for more details.

Usage

```
runDEGraph(pathway, expr, classes)
```

Arguments

pathway	One of the pathways contained in biocarta , kegg , nci or reactome .
expr	A matrix (size: number p of genes x number n of samples) of gene expression.
classes	A vector (length: n) of class assignments.

Details

The expression data and the pathway have to be annotated in the same set of identifiers.

References

L. Jacob, P. Neuvial, and S. Dudoit. Gains in power from structured two-sample tests of means on graphs. Technical Report arXiv:q-bio/1009.5173v1, arXiv, 2010.

Examples

```
if (require(DEGraph)) {
  data("Loi2008_DEGraphVignette")

  p <- convertIdentifiers(biocarta[["actions of nitric oxide in the heart"]], "entrez")
  runDEGraph(p, exprLoi2008, classLoi2008)
}
```

runSPIA

Run SPIA analysis

Description

Run topological analysis on expression dataset.

Usage

```
runSPIA(de, all, pathwaySetName, ...)
```

Arguments

de	A named vector containing log2 fold-changes of the differentially expressed genes. The names of this numeric vector are Entrez gene IDs.
all	A vector with the Entrez IDs in the reference set. If the data was obtained from a microarray experiment, this set will contain all genes present on the specific array used for the experiment. This vector should contain all names of the 'de' argument.
pathwaySetName	A list of pathways like kegg , nci or reactome .
...	Additional options to pass to spia .

Details

The spia option "organism" is internally used. It is an error use it in the additional options.

Value

The same of spia, without KEGG links. A data frame containing the ranked pathways and various statistics: pSize is the number of genes on the pathway; NDE is the number of DE genes per pathway; tA is the observed total perturbation accumulation in the pathway; pNDE is the probability to observe at least NDE genes on the pathway using a hypergeometric model; pPERT is the probability to observe a total accumulation more extreme than tA only by chance; pG is the p-value obtained by combining pNDE and pPERT; pGFdr and pGFWER are the False Discovery Rate and respectively Bonferroni adjusted global p-values; and the Status gives the direction in which the pathway is perturbed (activated or inhibited).

Examples

```
if (require(SPIA) && require(hgu133plus2.db)) {
  data(colorectalcancer)

  x <- hgu133plus2ENTREZID
  top$ENTREZ <- unlist(as.list(x[top$ID]))
  top <- top[!is.na(top$ENTREZ), ]
  top <- top[!duplicated(top$ENTREZ), ]
  tg1 <- top[top$adj.P.Val < 0.05, ]

  DE_Colorectal = tg1$logFC
  names(DE_Colorectal) <- as.vector(tg1$ENTREZ)
  ALL_Colorectal <- top$ENTREZ

  prepareSPIA(biocarta[1:20], "biocartaEx")
  runSPIA(de=DE_Colorectal, all=ALL_Colorectal, "biocartaEx")
}
```

runTopologyGSA	<i>Run topological analysis on expression dataset using topologyGSA. See topologyGSA.</i>
----------------	---

Description

Use graphical models to test the pathway components highlighting those involved in its deregulation.

Usage

```
runTopologyGSA(pathway, test, exp1, exp2, ...)
```

Arguments

pathway	One of the pathways contained in biocarta , kegg , nci or reactome .
test	Either "var" and "mean". Determine the type of test used by topologyGSA.
exp1	Experiment matrix of the first class, genes in columns.
exp2	Experiment matrix of the second class, genes in columns.
...	Additional parameters.

Details

This function produces a warning and returns NULL when the number of genes in common between the expression matrices and the pathway is less than 3.
