

# Package ‘MotifDb’

April 5, 2014

**Type** Package

**Title** An Annotated Collection of Protein-DNA Binding Sequence Motifs

**Version** 1.4.1

**Date** 2014-02-06

**Author** Paul Shannon

**Maintainer** Paul Shannon <pshannon@fhcrc.org>

**Depends** R (>= 2.15.0), methods, IRanges, Biostrings

**Suggests** RUnit, MotIV, seqLogo

**Imports** BiocGenerics, rtracklayer

**Description** More than 2000 annotated position frequency matrices from five public source, for multiple organisms

**License** Artistic-2.0 | file LICENSE

**License\_is\_FOSS** no

**License\_restricts\_use** yes

**LazyLoad** yes

**biocViews** GenomicSequence, MotifAnnotation

export

*export*

---

### Description

Writes all matrices in the supplied list, in the specified format, to the specified connection.

### Usage

```
## S4 method for signature MotifList,connection,character
export(object, con, format, ...)
## S4 method for signature MotifList,character,character
export(object, con, format, ...)
## S4 method for signature MotifList,missing,character
export(object, con, format, ...)
```

### Arguments

object	a MotifList object.
con	either a file connection or a filename or missing, implying stdout.
format	a character string, currently only 'meme' and 'transfac', which both produce the same result
...	ignore this

### Value

The matrices list is written to the specified connection in the specified format.

### Author(s)

Paul Shannon

### See Also

MotifDb, query, subset, flyFactorSurvey, hPDI, jaspar, ScerTF, uniprobe

### Examples

```
library (MotifDb)
# identify all the SOX genes
sox.indices = grep (^sox, values (MotifDb)$geneSymbol, ignore.case=TRUE)
matrices = MotifDb [sox.indices]
export (matrices, con=SoxGenes-meme.txt, format=meme)
```

**Description**

Approximately 2000 position frequency matrices collected from public sources, with ample accompanying metadata, and search and export capabilities provided.

**Details**

MotifDb is an R object of class MotifList, whose entries are numeric matrices, accompanied by a 'parallel' metadata structure, a DataFrame, in which each row provides information about the corresponding matrix. This object is automatically created and fully populated by data from five public sources (see below) when the package is loaded into your R environment via the library call. The matrices are obtained from six public sources:

FlyFactorSurvey:	614
hPDI:	437
JASPAR_CORE:	459
jolma2013:	843
ScerTF:	196
stamlab:	683
UniPROBE:	380

Representing primarily four organisms:

Dmelanogaster:	739
Hsapiens:	1898
Scerevisiae:	464
Mmusculus:	462
Rnorvegicus:	8
Celegans:	7
Zmays:	6
Athaliana:	5
Psativum:	3
Amajus:	3
Pfalciparum:	2
Gallus:	2
Xlaevis:	1
Vertebrata:	1
Taestivam:	1
Rrattus:	1
Phybrida:	1
Ocuniculus:	1
Nsylvestris:	1
Hvulgare:	1

```
Hroretzi:      1
Cparvum:       1
```

All the matrices are stored as position frequency matrices, in which each column (each position) sums to 1.0. When the number of sequences which contributed to the motif are known, that number will be found in the matrix's metadata. With this information, one can transform the matrices into either PCM (position count matrices), or PWM (position weight matrices), also known as PSSM (position-specific-scoring matrices). The latter transformation requires that a model of the background distribution be known, or assumed.

The names of the matrices are the same as rownames of the metadata DataFrame, and have been chosen to balance the needs of concision and full description, including the organism in which the motif was discovered, the data source, and the name of the motif in the data source from which it was obtained. For example: "Hsapiens-JASPAR\_CORE-SP1-MA0079.2" and "Scerevisiae-ScerTF-GSM1-badis".

Subsets of the Matrices may be obtained in several ways:

- By integer index, eg, MotifDb [[1]]
- By query, eg, as.list (query (MotifDb, FBgn0000014))
- (Interactively only) by subset as.list (subset (MotifDb, geneSymbol==Abda & !is.na (pubmedID)))

The matrices are stored in a SimpleList which has semantics very similar to the familiar list of R base. To examine a matrix, however, you must sidestep the MotifDb show method. These three commands display quite different results:

```
> MotifDb [1]
MotifDb object of length 1
| Created from downloaded public sources: 2012-Jul6
| 1 position frequency matrices from 1 source:
|   FlyFactorSurvey:    1
| 1 organism/s
|   Dmelanogaster:     1
Dmelanogaster-FlyFactorSurvey-ab_SANGER_10_FBgn0259750

> MotifDb [[1]]
  1  2  3  4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21

G 0.4 0.05 0.50 0.65 0 0 0 1 1 0.00 0.00 0.05 0.05 0.15 0.05 0.20 0.05 0.15 0.55 0.15 0.45
```

T 0.3 0.30 0.05 0.00 0 0 0 0 0 0.35 0.00 0.20 0.30 0.15 0.65 0.45 0.30 0.35 0.10 0.10 0.00

There are fifteen kinds of metadata – though not all matrices have a full complement: not all of the public sources are complete in this regard. The information falls into these categories, using the *Dmelanogaster-FlyFactorSurvey-ab\_SANGER\_10\_FBgn0259750* entry as an example (see below for the associated position frequency matrix):

1. providerName: "ab\_SANGER\_10\_FBgn0259750"
2. providerId: "FBgn0259750"
3. dataSource: "FlyFactorSurvey"
4. geneSymbol: "Ab"
5. geneId: "FBgn0259750"
6. geneIdType: "FLYBASE"
7. proteinId: "E1JHF4"
8. proteinIdType: "UNIPROT"
9. organism: "Dmelanogaster"
10. sequenceCount: 20
11. bindingSequence: NA
12. bindingDomain: NA
13. tfFamily: NA
14. experimentType: "bacterial 1-hybrid, SANGER sequencing"
15. pubmedID: NA

**Examples**

```
# are there any matrices for Sox4? we find two
mdb.sox4 <- MotifDb [grep (sox4, values (MotifDb)$geneSymbol, ignore.case=TRUE)]
# the same two matrices can be obtained this way also
if (interactive ())
  mdb.sox4 <- subset (MotifDb, tolower(geneSymbol)==sox4)
# and like this
mdb.sox4 <- query (MotifDb, sox4) # matches against all fields in the metadata
# implicitly invoke the show method
mdb.sox4
# get their full names
names (mdb.sox4)
# examine their metadata
values (mdb.sox4)
# examine the matrices with names include
as.list (mdb.sox4)
# export the matrices in meme format
destination.file = tempfile ()
export (mdb.sox4, destination.file, meme)
```

---

MotifList-class

*MotifList*

---

**Description**

A direct subclass of SimpleList, having no extra slots, in which listData is a list of position frequency matrices (PFMs), and the elementMetadata slot is a DataFrame with fifteen columns describing each matrix. Upon loading the MotifDb class, one MotifList object is instantiated and filled with matrices and their metadata. There should be no need for users to explicitly create objects of this class. When you load the MotifDb package, a fully-populated instance of this class is created, with > 2000 matrices with metadata

**Methods**

subset(x): extract matrices by metadata.  
 export(x): write matrices  
 show(x): describe matrices compactly  
 query(x): find matrices

**Author(s)**

Paul Shannon

**Examples**

```
# Examine the number of matrices contributed by each source.
print (table (values (MotifDb)$dataSource))
```

---

query	<i>query</i>
-------	--------------

---

**Description**

A very general search tool, returning all matrices whose metadata, in ANY column, is matched by the query string.

**Usage**

```
## S4 method for signature MotifList
query(object, queryString, ignore.case=TRUE)
```

**Arguments**

object	a MotifList object.
queryString	a character string
ignore.case	a logical value, default TRUE

**Value**

A list of the matrices

**Author(s)**

Paul Shannon

**See Also**

MotifDb, subset, export, flyFactorSurvey, hPDI, jaspar, ScerTF, uniprobe

**Examples**

```
mdb <- MotifDb
matrices.human = query (mdb, hsapiens)
matrices.sox4 = query (mdb, sox4)
uniprobe.sox.matrices = query (query (mdb, uniprobe), ^sox)
```

---

subset	<i>subset</i>
--------	---------------

---

### Description

An analog of the base package subset method, this version will return all the matrices whose meta-data match the (possibly intricate) logical expression in the "subset" argument.

Note: just as with the base subset method, this method is unreliable except when used interactively. Batch, script or other programmatic use of this function is to be avoided.

### Usage

```
## S4 method for signature MotifList
subset(x, subset, select, drop=FALSE, ...)
```

### Arguments

x	a MotifList object.
subset	a logical expression whose terms are predicates on the column names of the metadata table
select, drop, ...	these are ignored, appearing here only in fidelity to the generic definition of the method.

### Value

A list of the matrices whose metadata satisfies the supplied subset

### Author(s)

Paul Shannon

### See Also

MotifDb, query, export, flyFactorSurvey, hPDI, jaspar, ScerTF, uniprobe

### Examples

```
mdb <- MotifDb
if (interactive ()) {
  matrices <- subset (mdb, dataSource==UniPROBE)
  egr1.matrices <- subset (mdb, geneSymbol==Egr1)
  jaspar.egr1.matrices <- subset (mdb, geneSymbol==Egr1 &
                                dataSource == JASPAR_CORE)
  # one of the mouse egr1 matrices has a geneSymbol Zif268, but
  # has the proper entrez geneId.
  all.egr1.matrices <- subset (mdb, geneId==13653)
}
```
