## Description

Extracts the genus name from a scientific name

## Usage

genus(x)

**Arguments**

x                    A vector of scientific names

**Details**

Removes single quotes, brackets and candidate qualifiers.

**Value**

A vector of genus names

**Examples**

```
genus("[Bacillus] selenitireducens")
```

reports

*Genome and assembly reports*

---

**Description**

Genome and assembly reports from the NCBI genomes FTP

**Usage**

```
reports(file, assembly = FALSE, ...)
```

**Arguments**

file                file name, if missing then the files in the FTP directory are listed  
assembly            use ASSEMBLY\_REPORTS directory, default is GENOME\_REPORTS  
...                  additional options passed to read\_delim

**Details**

Uses read\_delim in the readr package to read genome or assembly reports in the genomes FTP

**Value**

A list of files if file name is missing, otherwise a data.frame with class c("tbl\_df", "tbl", "data.frame").  
If dplyr is loaded, then printing will return the first ten rows and not the first 10,000.
